Did you know that with over 90% of current Push/Pull Brake/Accelerators on the market, you are restricted to a pre-determined fixed steering wheel position?

Did you know that many Push/Pull Brake/Accelerators on the market require the airbag to be removed or disconnected?

With the new BAS Push/Pull Brake/Accelerator, customer safety is never compromised!

The new design allows for full movement of the steering wheel, allowing each driver to set the wheel at the best and **safest** driving position for them.

In addition to this there are a range of handles and handle bars to choose from, ensuring a bespoke driving experience for every customer.

The new design means that the vehicle's airbags are never removed or interfered with.

The positioning of the Push/Pull is such, that if the airbag is deployed, the driver's **safety** is not compromised.

An added bonus with the new design is that on 95% of vehicles, there is no cutting or reshaping of the vehicle's trim or components.

This is unlike current Push/Pull Brake/Accelerators, where almost all require some cutting of vehicle trims.

Your Local Agent

In our opinion, the BAS Push/Pull is the safest Push/Pull Brake/Accelerator on the market!

Ask your Dealer or Installer to select the BAS Push/Pull if you value the safety of yourself and your family.

Here at BAS, we do!
